Discharge Information

1 Your chest pain diagnosis

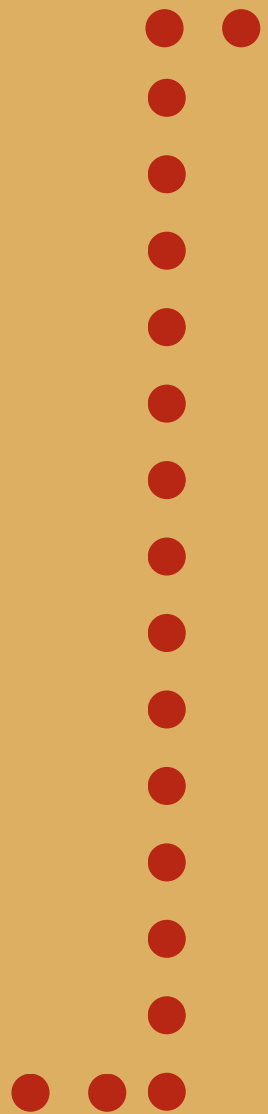

Our testing has NOT shown any evidence of heart attack. This is based on blood tests, an electrocardiogram (ECG) and your risk factors.

2 Further evaluation

We feel that it is safe to discharge you home. You should follow up with your doctor in the next 3-5 days. However, even though everything today is normal, your chest pain may be an early warning sign of FUTURE heart disease. If you develop recurrence or worsening of symptoms, you should seek medical attention immediately.

3 Your personal risk evaluation

Your risk of a heart attack or heart complication within the next 30 days can be determined by comparing you to people with similar factors who also came to the Emergency Department with chest pain.

Of every **100** people with risk factors like yours who came to the Emergency Department with chest pain...

ONE had a heart attack or heart complication within 30 days of their Emergency Department visit. **99** did not.
